

Audit Your Way to Savings

Why You Need an MBox Audit

Are you maintaining an air compressor capacity unnecessarily high for your current manufacturing operations? Conduct an MBox Audit with Air Technologies® and take a step towards improving your bottom line with controlled operational costs. If you've recently experienced a change in your manufacturing operations without a similar adjustment to your compressed air you are likely paying more than you should be.

An **MBox** Audit is a week long 24/7 profile of your production air requirements and cost. During the audit you operate normally and our M-Box data loggers record the activity of your compressors. You receive a detailed report with your compressor scope of supply, data pages (including power and air consumption, load cycles, running hours, etc.), profile graphs and charts, and an executive summary.

What Does an MBox Audit Do For You?

- Records hard data based on actual measurements of your air compressor in use
- Shows exactly where you can make improvements in your compressed air system to reduce operating costs
- Plots simulations using your data to show benefits of upgrading to new technology
- Projects payback periods to justify a cost-saving capital investment.
- Provides professional audit/profile reports
- If your compressed air system is running efficiently, we'll tell you
- If you can run your compressed air system more efficiently, we'll show you how
- If fixing problems or upgrading to more efficient technology will pay for itself, we'll back it up with data and propose a solution
